Practice Lab (August 3 2017)

Order information form. Implement a subset of the following requirements as specified by your instructor.

(a) Create an HTML document (web page) that gathers information as part of an online product ordering system. This page will request shipping and billing name and address, credit card information, and contact information (e-mail address and phone number). It should provide a menu from which the type of credit card (from a list of approximately four options) can be selected; the default selection should be "Select a Credit Card." There should also be fields for entering the card number and expiration date. Furthermore, there should be a checkbox, initially checked, that is labeled "Please keep me informed about future product offerings." Finally,provide submit and clear buttons. All form controls should have appropriate name attributes. Use the GET method for form submission, and specify the empty string for the actionExample order form layout.

(b) Improve the layout of the form in (a), as illustrated in Figure Use fieldset elements to enclose related controls in four groups: shipping, billing, credit card, and contact information (including the checkbox). The submit and clear buttons can be placed outside a fieldset. Within each fieldset, use tables to align the text boxes so that the left edges of the text boxes are all the same distance from the edge of the fieldset, even if the labels of the boxes are of different lengths.
